

COMP0178: Database Fundamentals

Query exercises

Additional exercises

8. For each date with orders, display how many orders were placed on that date. Sort the results by date (note: since the date is varchar data rather than a date object, sorting will sort alphabetically rather than chronologically, but that is OK for this exercise).
9. Which states are responsible for the most money spent on sales? List state and total spent in descending order.
10. List order information (orderID, custID, date) for all orders involving a flashlight.
11. For each supplier, list how many items are stocked by that supplier in this shop.
12. List all orders that are still being fulfilled (not all items have been despatched).
